

CASE STUDY

ECOCON Decorative Products: Saving Without Compromise.

ECOCON Group has introduced to the UAE market a new solution for buildings decoration. ECOCON non-autoclave aerated lightweight cellular concrete is a perfect material for making different décor items for outdoor installation. UAE Ministry of Public Works was looking for constructing attractive villas without spending additional funds for expensive GRC items. At the same time there was no compromise in quality and in-time completion of works. ECOCON decorative cornices and brackets was the right choice.

Reduced cost with equal quality

Today, decorations of building façade have become a prominent design feature and traditional heritage shapes of the houses are very popular in the UAE. At the same time such decorations require additional expenses and increase construction cost. This pushes architects and consultants to avoid decorative elements on the facades and thus making designs flat and not impressive. Introduction of ECOCON decorative cornices, brackets and other decorative units introduces a solution when the cost of decoration is substantially lower than alternative GRC elements. Plus, to this ECOCON decorations are 5 times lighter than GRC or concrete and have practically endless durability. Due to light weight the fixing of ECOCON elements is simple and reliable. The combination of mechanical fixing (galvanized anchor bolts) and specially produced construction adhesive for vertical surfaces provides reliable and long-lasting fixing to concrete structures.

ECOCON Industries L.L.C has been registered with UAE Ministry of Public Works as official supplier.
